## Optgen: A Generator for Local Optimizations

## Sebastian Buchwald

## Local Optimizations

## Local optimizations:

- IR level
- SSA form
- Data dependency graph
- Do not require any global analysis
- Can be applied at any time during compilation

## Generation of Local Optimizations

## Goal

Generate all local optimizations (up to a given cost limit).

## Input:

- Set of operations and their costs
- Cost limit
- Bit width

## Output:

- Complete set of verified local optimizations

## Related Work - Peephole Generators

## Assembly level

IR level

- Peephole of $k$ instructions
- Architecture-specific
- Precise cost model
- Pattern of $k$ values
- Independent of Architecture
- SSA form

## Common Design of Peephole Generators

Generator Generates all possible instructions sequences
Semantic Checker Proofs the equivalence of two instruction sequences

## Design of Optgen (so far)

Generator Generates all possible expressions
Semantic Checker Proofs the equivalence of two expressions

## Design of Optgen (so far)

## Semantic hash:

- Evaluate expression for precomputed test inputs
- semantic_hash $(x)=$ semantic_hash(x | 0)

## Example

## Optgen parameters:

- Operations:
- Constants (cost: 0)
- And (cost: 1)
- Or (cost: 1)
- Not (cost: 1)
- Cost limit: 2
- Bit width: 8

## Example - Costs 0

## Enumerate expressions with costs 0 :

- X
- 0
- 1
- 255

## Example - Costs 1

## Combine expressions with existing operations:

- y
- x \& x
- Same semantic hash class as x
- SMT check: x \& $\mathrm{x}=\mathrm{x}$
- Optimization: $\mathrm{x} \& \mathrm{x} \rightarrow \mathrm{x}$
- x \& 0
- Same semantic hash class as 0
- SMT check: x \& $0=0$
- Optimization: $\mathrm{x} \& 0 \rightarrow 0$

## Example - Costs 2

Combine expressions with existing operations:

- ( $x \& y$ ) \& 0
- Rule x \& $0 \rightarrow 0$ applicable
- No further action

## Design of Optgen (so far)

## Example - Constant Folding Rules

Constant folding rules:

- 0 \& $0 \rightarrow 0$
- 0 \& $1 \rightarrow 0$
- $0 \& 2 \rightarrow 0$
$2^{16}$ rules
- $255 \& 255 \rightarrow 255$

## Expected rule:

- c0 \& c1 $\rightarrow$ eval (c0 \& c1)

## Design of Optgen

## Example - Generalize Rules

## Generalize constant folding rules:

1. Introduce symbolic constants

- Like variables
- Allow constant folding

## Example - Generalize Rules

Generalize constant folding rules:
2. Collect syntactically equivalent rules

## Example - Generalize Rules

Generalize constant folding rules:
3. Replace constants of LHS with symbolic constants

## Example - Generalize Rules

## Generalize constant folding rules:

4. Iterate through generated expressions to find appropriate RHS

## Example - Conditional Rules

## Symbolic rules not sufficient:

- ( $x \mid 2$ ) \& $1 \rightarrow x$ \& 1
- ( $x$ | 1) \& $2 \rightarrow x \& 2$
- ( $x \mid 1$ ) \& $3 \nrightarrow x \& 3$

## Example - Conditional Rules

## Symbolic rules not sufficient:

- ( $x \mid 2$ ) \& $1 \rightarrow x \& 1$
- ( $x \mid 1$ ) \& $2 \rightarrow x \& 2$
- (x | 1) \& $3 \nrightarrow x \& 3$

## Solution:

- Conditional rule: c0 \& c1 $==0 \Rightarrow(x \mid c 0) \& c 1 \rightarrow x \& c 1$
- Iterate through generated expressions to find appropriate condition
- Condition: c0 \& c1 == 0

## Example - Result

Optgen finds 42 optimizations:

- 19 rules with symbolic constants
- 8 rules with condition
- 11 rules without condition
- 12 rules with non-symbolic constants
- 11 rules without constants

## Example - Result

Optgen finds 42 optimizations:

- 19 rules with symbolic constants
- 8 rules with condition
- 11 rules without condition
- 12 rules with non-symbolic constants
- 11 rules without constants

## Question

What happens if we use a bit width of 32 bit?

## Example - Result

Optgen finds 42 optimizations:

- 19 rules with symbolic constants
- 8 rules with condition
- 11 rules without condition
- 12 rules with non-symbolic constants
- 11 rules without constants

## Question

What happens if we use a bit width of 32 bit?

## Extension to 32 Bit: Correctness

Basic idea:

- Generate rules for 8 bit
- Extend rules from 8 bit to 32 bit
- Verify extended rules for 32 bit

## Extension of bit width:

- Rules without non-symbolic constants
- Independent of bit width
- $\mathrm{x} \& \mathrm{x} \rightarrow \mathrm{x}$
- Rules with non-symbolic constants
- Try to prepend or append 0/1 bits
- $\mathrm{x} \& 0 \mathrm{xFF} \rightarrow \mathrm{x}$
- $\mathrm{x} \& 0 \mathrm{xFF} 000000 \rightarrow \mathrm{x}$
- $\mathrm{x} \& 0 \mathrm{xFF} F \mathrm{FFFFF} \rightarrow \mathrm{x}$
- $\mathrm{x} \& 0 \mathrm{x} 000000 \mathrm{FF} \rightarrow \mathrm{x}$
- $\mathrm{x} \& 0 \mathrm{xFFFFFFFF} \rightarrow \mathrm{x}$
- Works fine in practice

## Extension to 32 Bit: Completeness

## Basic idea:

- Increase bit width until the number of rules stabilizes

| Bit width | Number of rules |
| :---: | :---: |
| 1 | 24 |
| 2 | 38 |
| 3 | 42 |
| 4 | 42 |
| $\ldots$ | $\ldots$ |
| 32 | 42 |

## Drawback:

- Does not work for all operations

## Evaluation

## Full run:

- Operations: Constants, Minus, Not, Add, And, Or, Sub, Xor
- Cost limit: 2
- Generation: 8 bit
- Verification: 32 bit
- 6 h 7 min 0 s
- 1046568 kB

## Testsuite:

- LLVM: 23 missing optimizations
- GCC: 27 missing optimizations
- ICC: 62 missing optimizations

## Optimization Differences

| Optimization | Compiler |  |  |
| :---: | :---: | :---: | :---: |
|  | LLVM | GCC | ICC |

## Conclusion

Optgen

- is the first generator that supports arbitrary constants
- guarantees correctness and completeness of generated optimizations
- has revealed missing optimizations in all state-of-the-art compilers

There is more wisdom in the paper.

## No

## Optimizations 1/5

| 5. | $(x \& y) \mid(z \& y) \rightarrow y \&(x \mid z)$ | $\checkmark$ | $\times$ | $\checkmark$ |
| 6. | $x-((x-y)+(x-y)) \rightarrow y+(y-x)$ |  | $\checkmark$ | $\times$ |
| 7. | $(x-y)-(x+z) \rightarrow-(y+z)$ | $\checkmark$ | $\checkmark$ | $\times$ |
| 8. | $((x-y)+(x-y))-x \rightarrow x-(y+y)$ | $\checkmark$ | $\checkmark$ | $\times$ |
| 9. | $(x+x) \oplus(y+y) \rightarrow(x \oplus y)+(x \oplus y)$ | $\times$ |  |  |
| 10. | $(x \& y) \oplus(z \& y) \rightarrow y$ \& $(x \oplus z)$ | $\checkmark$ | $\times$ | $\checkmark$ |

State-of-the-art compilers apply optimizations rules even if the operands are shared. If the compiler supports the optimization $\checkmark / \times$ indicates whether the compiler prevents the optimization in case of shared operands. If the compiler does not support the optimization the item is left blank.
